

ApplyWizz DicePilot

Document 01 - PRD - Product Requirements Document

The product north star for the one-candidate Dice auto-apply pilot

Product	ApplyWizz DicePilot
Version	V1.0 - Pilot Specification
Scope	V1 only: one internal test candidate, up to 20 Dice C2C + Easy Apply jobs, sequential processing
Date	20 August 2026

1. Executive Summary

ApplyWizz DicePilot V1 is an internal pilot that proves ApplyWizz can take a controlled queue of up to 20 qualifying Dice jobs for one authorized test candidate and process Dice Easy Apply applications sequentially from start to verified outcome.

V1 boundary

One candidate only. Dice only. Up to 20 jobs. C2C-relevant + Easy Apply only. Applications run one at a time. Every job must end in SUBMITTED, FAILED, or NEEDS_INPUT. Multi-candidate scale is explicitly deferred.

2. Product Name and Tagline

Item	Definition
Product name	ApplyWizz DicePilot
Internal version	V1.0 - Pilot Specification
Tagline	Verified C2C Dice Easy Apply, executed end to end for one candidate.
Primary outcome	Prove reliable, auditable sequential Dice application execution before scaling to more candidates.

3. Problem Statement

ApplyWizz already has candidate data, resume assets, job-role information, job discovery/matching infrastructure, and Supabase-based data flows. The missing proof is application execution: reliably opening an eligible Dice job in the candidate's authenticated session, completing Easy Apply, handling known vs unknown questions safely, submitting, verifying success, and advancing to the next job without duplicate or false-positive submissions.

4. Target User

The V1 user is an internal ApplyWizz operator using one authorized test candidate account. The candidate has provided valid application information and a resume through existing ApplyWizz systems. V1 is not a public self-service product and does not yet support multiple independent customer tenants.

5. V1 Goal

Demonstrate a repeatable one-candidate application loop against up to 20 Dice jobs that have been validated as C2C-relevant and Dice Easy Apply eligible.

1. Discover or receive candidate-relevant Dice jobs.
2. Filter to Contract / Third Party candidates and classify C2C suitability.
3. Confirm Dice Easy Apply eligibility.
4. Queue up to 20 jobs in Supabase for one test candidate.
5. Load candidate application data from the existing ApplyWizz candidate-details route.
6. Use one persistent authenticated Dice browser profile for that candidate.
7. Complete applications sequentially, one job at a time.
8. Use known candidate facts for deterministic answers; never guess unknown or sensitive facts.
9. Verify the Dice success state before marking an application SUBMITTED.
10. Record outcome and advance to the next queued job.

6. Must-Have Features

ID	Feature	Requirement
P0-01	Dice job intake	System can ingest Dice job URLs/IDs from the Dice discovery flow or a controlled test list.
P0-02	Contract/Third Party filter	Jobs are restricted to Dice employment types relevant to contract/C2C sourcing.
P0-03	C2C classifier	Job description is evaluated for positive, negative, or ambiguous C2C evidence.
P0-04	Easy Apply detector	System confirms the job supports Dice Easy Apply before application execution.
P0-05	Supabase queue	Eligible jobs are persisted with one candidate assignment and deterministic status.
P0-06	Candidate adapter	Existing ApplyWizz candidate payload is normalized into application-ready facts.
P0-07	Persistent browser	One persistent Dice browser profile/session is used for the test candidate.
P0-08	Resume handling	Existing candidate resume can be selected/replaced/uploaded as required by Dice.
P0-09	Known questions	Supported application fields are filled from normalized candidate facts.
P0-10	Unknown questions	Unknown, ambiguous, sensitive, or unsupported questions stop safely as NEEDS_INPUT.
P0-11	Sequential execution	Only one job is processed at a time for the candidate.
P0-12	Submission verification	SUBMITTED is written only after a verified Dice success state.
P0-13	Failure recording	Errors are classified and stored with useful context.
P0-14	Duplicate protection	Same candidate/job pair cannot be submitted twice unintentionally.
P0-15	Minimal operator view	Operator can see queued, current, submitted, failed, and needs-input counts.

7. Nice-to-Have Features - Not Required for V1

- Screenshot evidence on every state transition rather than only on errors/submission.
- Automatic retry for a narrow set of clearly transient browser/network failures.
- Job-level C2C confidence score with explanation.
- Compact downloadable run report for the 20-job pilot.
- Manual operator retry button for FAILED_RETRYABLE jobs.

8. Explicitly Out of Scope

Deferred area	Reason
Multiple candidates	V1 proves correctness before multi-tenant scaling.
Parallel applications for one candidate	Sequential execution is easier to audit and avoids conflicting session state.
Telegram intervention	V1 can use NEEDS_INPUT in the operator workflow; messaging comes later.
Zoho/recruiter email automation	Post-application communications are V2+.
AI-tailored resume per job	Use existing verified resume first; tailoring is added after execution reliability is proven.
Rate negotiation / RTR automation	Candidate approval workflow belongs to later recruiter automation.
External ATS applications	V1 is Dice Easy Apply only.
Other job boards	No LinkedIn, Indeed application execution, Workday, Greenhouse, etc.
Billing/subscriptions	Pilot is internal.
Public mobile application	No customer-facing mobile product in V1.
CAPTCHA/security bypass	Security challenges pause for legitimate user action; no bypass behavior.

9. User Stories

Actor	User story
ApplyWizz operator	As an operator, I want to queue 20 qualifying Dice jobs for one candidate so I can test the application engine in a controlled run.
ApplyWizz operator	As an operator, I want to see the current job and final outcome of every job so I can audit the run.
Candidate	As the test candidate, I want the system to use only facts I have provided so it does not invent application answers.
Candidate	As the test candidate, I want security or unknown questions to pause instead of being guessed.
Engineering	As an engineer, I want deterministic statuses and event logs so failures can be reproduced and fixed.
Engineering	As an engineer, I want submission verification so a click is never confused with a successful application.

10. Core Business Rules

11. A job may enter the application queue only if Dice Easy Apply is positively detected.

12. C2C classification must not treat generic Contract as equivalent to confirmed C2C; ambiguous jobs may be marked LIKELY or UNKNOWN according to classifier policy.
13. Excluded companies from the candidate payload must be honored before queueing or before submission.
14. Candidate facts come from the existing ApplyWizz candidate route and its normalized adapter; browser automation must not independently invent facts.
15. Sensitive facts are never inferred from unrelated fields.
16. A job is not marked SUBMITTED until a success confirmation is observed.
17. Each candidate/job pair is idempotent and duplicate-protected.
18. Security challenges are handled as a legitimate intervention point, not bypassed.
19. After a terminal outcome, the worker advances to the next queued job.
20. V1 stops after the configured pilot limit, with a maximum of 20 queued jobs in the controlled run.

11. Status Model

Status	Meaning	Terminal?
QUEUED	Eligible job is waiting for the candidate worker.	No
PROCESSING	Worker owns the application and is executing browser steps.	No
NEEDS_INPUT	Human answer or security action is required.	No
SUBMITTING	Final submission action has been initiated; verification pending.	No
SUBMITTED	Dice success state has been positively verified.	Yes
FAILED_RETRYABLE	Transient or recoverable failure; operator/worker may retry safely.	No
FAILED	Terminal failure or unsupported flow for V1.	Yes

12. Success Metrics

Metric	V1 target
Pilot candidate count	Exactly 1 authorized internal test candidate
Pilot queue size	Up to 20 qualifying Dice jobs
Duplicate submissions	0
Guessed unknown/sensitive answers	0
False SUBMITTED states	0
Outcome completeness	100% of attempted jobs have a recorded final/current status
Auditability	Each job has timestamped execution events and error context where applicable
Sequential integrity	No overlapping application execution for the same candidate/browser profile

13. Acceptance Criteria

21. An operator can identify a single candidate and prepare a pilot queue of up to 20 eligible jobs.
22. For every queued job, the system can display title/company/URL/C2C classification/Easy Apply status.
23. The worker reads the next QUEUED item deterministically and acquires a candidate execution lock.
24. The worker can reuse the candidate's authenticated Dice session instead of creating a completely fresh identity for every job.
25. The worker can open a Dice job, start Easy Apply, handle the existing resume, traverse supported steps, and fill supported known answers.
26. Unsupported questions transition the application to NEEDS_INPUT without making up an answer.
27. After submission, the worker confirms a Dice success state before saving SUBMITTED.
28. A failed job stores an error code/message and does not silently disappear.
29. Once a job reaches a terminal state, the worker selects the next eligible job.
30. At the end of the pilot, the operator can see a complete 20-job outcome summary.

14. V2 and Final Product - Context Only

V2 will introduce multiple candidate browser profiles, candidate-specific queues, richer answer memory, Telegram intervention, safe retries, and truthful job-specific resume tailoring. The final product may add recruiter inbox intelligence, rate/RTR workflows, analytics, broader platform support, and customer-facing experiences. These items are context only and must not be implemented as part of the V1 plan.
