

ApplyWizz DicePilot

Document 04 - UI/UX Design Brief

A restrained internal operations interface for monitoring one-candidate automation

Product	ApplyWizz DicePilot
Version	V1.0 - Pilot Specification
Scope	V1 only: one internal test candidate, up to 20 Dice C2C + Easy Apply jobs, sequential processing
Date	20 August 2026

1. Design Objective

The V1 interface should feel like a reliable operations console, not a flashy consumer job app. The operator must immediately understand whether the candidate browser is healthy, which application is running, what is blocked, and how many of the 20 jobs have reached a verified outcome.

2. Aesthetic Direction

Attribute	Direction
Overall style	Minimal, operational, trustworthy, data-dense without feeling cramped.
Reference feel	Linear / Vercel / modern admin console - clean hierarchy and clear status semantics.
Primary mode	Light mode for V1 unless the existing ApplyWizz admin UI already establishes another system.
Decorative elements	Minimal. No gradients, gaming-style progress, or unnecessary animation.
Tone	Calm and precise. Automation is visible and auditable, not magical.

3. Color System

Token	Suggested value	Usage
Primary	#1D4ED8	Primary action, active navigation, links.
Background	#F8FAFC	Page background.
Surface	#FFFFFF	Cards, tables, panels.
Text primary	#111827	Main headings/body.
Text secondary	#6B7280	Metadata, explanatory text.
Success	#166534	SUBMITTED, browser healthy.
Warning	#B45309	NEEDS_INPUT, session attention.
Error	#991B1B	FAILED.
Processing	#1D4ED8	PROCESSING/SUBMITTING.
Border	#E5E7EB	Subtle dividers/table borders.

4. Typography

Element	Guideline
Font	Inter if existing frontend supports it; otherwise preserve existing ApplyWizz system font.
Page title	24-28px, 600-700 weight.

Section title	16-18px, 600 weight.
Body	14-15px.
Table	13-14px.
Status label	12px, 600 weight, compact badge.
Monospace	Only for IDs/error codes/technical event details.

5. Layout

Desktop-first internal console. V1 should remain usable at tablet widths but a full mobile product is out of scope.

Region	Content
Header	DicePilot title, candidate identity, worker/browser status.
Top summary strip	Processed, Submitted, Failed, Needs Input, Remaining.
Primary column	Current application card with step progression.
Secondary/adjacent panel	Browser/session health and last event.
Main lower area	20-job application queue table.
Drawer/modal	Needs Input or application event detail.

6. Dashboard Wireframe Specification

Recommended composition

Header: ApplyWizz DicePilot | Candidate | Dice session status. Below: progress bar and five counts. Then: Current Application card with state checklist. Then: a table of all selected jobs. Needs Input should be visually distinct and actionable without looking like an error.

Component	Required content
Candidate identity	Name or safe internal label, ApplyWizz ID optional, no unnecessary sensitive data.
Browser badge	Logged In / Needs Login / Needs Security Action / Worker Offline.
Progress	X / 20 processed plus counts.
Current job	Role, company, short URL/action, current state, start time.
Step list	Opened job; Easy Apply; Resume; Questions; Review; Submit; Verify.
Queue table	Index, role, company, C2C class, Easy Apply, status, last update, details action.

7. Status Badge Semantics

Status	Visual treatment	Operator interpretation
QUEUED	Neutral gray	Waiting; no action needed.
PROCESSING	Blue with subtle activity indicator	Worker is actively executing.
NEEDS_INPUT	Amber	Human action required; highest attention priority.
SUBMITTING	Blue, distinct text	Final action initiated but success not verified.
SUBMITTED	Green	Verified successful submission.
FAILED_RETRYABLE	Orange/red outline	Recoverable failure; inspect before retry.
FAILED	Red	Terminal V1 failure.

8. Current Application Card

1. Show job title and company prominently.
2. Show current application status and browser state separately.
3. Display a vertical or horizontal step checklist: Open -> Eligibility -> Resume -> Questions -> Review -> Submit -> Verify.
4. Completed steps use check marks; current step uses a progress indicator; future steps remain neutral.
5. If NEEDS_INPUT occurs, replace generic progress message with the exact reason category and a View Required Input button.
6. Do not display SUBMITTED until verification step is complete.

9. Queue Table Behavior

Behavior	Requirement
Default sort	Queue order / created_at for the pilot.
Row click	Open application detail.
Status updates	Poll or realtime-update from Supabase; no page reload required if feasible.
Failed row	Show concise error category, not huge stack trace in the table.
Needs input row	Pin or visually emphasize.
Submitted row	Show verified submission timestamp.
Job URL	External-link affordance; never use URL text as main table content.

10. Needs Input Experience

Needs Input is a normal safe automation state, not a catastrophic error.

Field	Display
-------	---------

Application	Job title + company
Reason category	Unknown question / authentication / security action / missing candidate fact
Question	Exact visible question text where appropriate
Options	Exact choices returned by the application form if applicable
Existing candidate data	Only relevant non-sensitive mapped facts; avoid dumping full profile JSON
Action	Provide approved answer / confirm manual security completion / cancel application
Audit	Record who/what supplied the answer and timestamp

11. Application Detail Page

- Top summary: job, company, status, C2C classification, Easy Apply, attempts.
- Timeline: timestamped application_events.
- Submission verification: confirmation text/evidence reference, if submitted.
- Error diagnostics: error code, state, screenshot/trace reference; stack trace behind technical disclosure.
- Candidate-data usage: list mapped field keys, not raw sensitive values.
- Retry action only when status policy says safe.

12. Responsive Requirements

Viewport	Requirement
1280px+	Full dashboard with current application and browser-health panel side by side.
768-1279px	Stack panels; queue remains usable with horizontal scroll if needed.
<768px	Basic monitoring remains readable, but full mobile optimization is not a V1 acceptance criterion.

13. Accessibility

- Status must never rely on color alone; always show a text label/icon.
- Maintain readable contrast for status badges and body text.
- Buttons and interactive table rows must be keyboard reachable.
- Loading indicators require accompanying text.
- Error and needs-input messages should be announced in semantic alert/status regions where practical.
- Avoid tiny table text or truncated critical statuses.

14. V1 UI Non-Goals

- No candidate onboarding redesign.
- No customer billing/subscription UI.
- No Telegram-like chat interface.
- No recruiter CRM.
- No resume editor.
- No public landing page.
- No large analytics dashboard.
